

### User manual

## Magnetic rail, series TBxx, TGxx, TZxx and TRxx

Aid for transporting cans, lids, caps, etc., standing or laying on a transport belt, while being magnetically attracted onto the transport belt.

*The descriptions and pictures in this manual, used for explanation, may differ from your execution.  
We have enclosed the as-built drawing of the delivered article.*

---

**Versions overview of standard manual**

Version	Date	Description
1.0	03/2010	First version of the English version of the user manual. Before only a pamphlet with warnings was delivered with the magnets
2.0	12/2019	Update layout and logo

## Introduction

Read this manual and make sure that you fully understand its contents before commissioning and operating the machine.

If you have any queries or require further explanation regarding any subject related to the machine, please do not hesitate to contact  
**GOUDSMIT Magnetic Systems B.V.**

All technical information contained in this manual, together with any relevant drawings and technical descriptions we supply, remain our property. It may not be duplicated or disclosed without our prior written permission.

The user manual can be ordered together with the device description and/or the article number as well as the order number.

- This manual and the declaration by the manufacturer are part of the machine.
- They must remain with the machine, even if it is sold.
- The manual must be made available to all operators, service technicians, and others who work with the machine throughout its life cycle.

**General**

This manual contains information for the correct operation and maintenance of your device. It also contains instructions for avoiding possible injury and serious damage and it allows a safe and as trouble-free functioning of the product as possible. Read this manual thoroughly before putting the device into operation, familiarise yourself with the operation and control of the device and follow all instructions precisely.

- *The data published in this manual is based on the available information at the time of delivery. This is issued subject to later amendment.*
- *We retain the right to amend or modify the construction and/or model of our products at any time whatsoever without any obligation to modify any previously supplied products accordingly.*

**Ferromagnetism**

The working principle of the device rests on (Ferro)magnetism.

Ferromagnetism is the basic mechanism by which certain materials such as iron cobalt and nickel can get magnetized when exposed to an externally applied magnetic field. Materials that remain magnetized after the external magnetic field is removed, are called permanent magnets. Most magnetic materials lose their magnetism after the external magnetic field is removed. Most alloys of iron, cobalt and nickel are magnetic. However, some stainless steel alloys like AISI304 or AISI316 are only slightly magnetic.

Because in most cases it will be Fe parts that will be Ferro-magnetically influenced, we will use the term 'Fe' in this user manual when we mean ferromagnetic material

**Conditions of supply and guarantee**

The conditions of supply are the “**General Conditions for the supply and erection of mechanical, electrical and electronic products**” (SE01), published by *Orgalime*, in Brussels.

These conditions can also- if desired – be requested by writing to Goudsmit Magnetic Systems B.V., as also mentioned in our written quotation.

The guarantee prescriptions are mentioned in these conditions.

**The guarantee on your equipment will be void if:**

- Service and maintenance are not performed in accordance with the instruction manual or by servicemen who are not especially trained to do the work. We strongly recommend that specific magnetic service and maintenance be carried out by Goudsmit personnel).
- Modifications are made to the equipment without our prior written permission.
- Non-original parts or non 100% exchangeable parts are used.
- Lubrication products other than those prescribed are used.
- The equipment is used injudiciously, incorrectly, negligently or not in accordance with its intent and/or purpose (see chapter “Intended use / user instructions”).

All parts that are subject to wear are excluded from the guarantee.

**Remaining remarks / warnings**

- Use the device only for the application for which it has been designed (see chapter “*Intended use / user instructions*”).
- Use the device only when it is in technically perfect condition, and ensure that all protective hoods or inspection covers, including all safety circuits, have been fitted and installed in the correct manner.
- Ensure that device maintenance is appropriate and in accordance with the instructions provided in this user manual.
- Any eventual faults, in particular those that may influence safety, should be attended to immediately and remedied before renewed operation. Should you, after estimating the risks of an unsolved fault, still think it is safe to keep the device into operation, then warn the operators and maintenance staff of these faults and the danger(s) caused by these faults.

## General

**Delivery****General**

**Check the shipment immediately on delivery for:**

- Possible damage and/or shortcomings as a result of transport. If so, ask the transporter to draw up a transport damage report.
- Completeness of the delivery/deliveries, the absence of anything (additionally) ordered.

Always immediately contact **GOUDSMIT magnetic systems** in the event of any damage and/or mistaken delivery.

**Identification plate**

On the device you will find an identification plate as pictured below. **Information on this plate is of great importance in case of service.** That is why we advise to maintain this plate on the device at all times. Ensure that it is always legible by cleaning regularly.

**The identification can be placed as:**

1. A sticker
2. A metal plate
3. An etching (stainless steel casings)

North or South  
Magnetisation  
direction of the  
magnetic side

## Safety

*This chapter describes the safety risks of your device. Where necessary, warning pictograms are attached to the device. This chapter clarifies the meaning of these pictograms.*

### Know your pictograms !

*Regularly check that all warning pictograms are still present and legible, and clean if necessary. Make sure that new pictograms are applied at their correct locations if they have been lost or damaged. Before installing the device, record where the pictograms were originally placed.*

### General

The device is provided with safeguards where necessary. Make sure every person who comes in contact with the device, wears adequate personal protection (overalls, safety glasses, hearing protectors, helmet, steel-toed safety shoes etc.).

Areas of the device considered dangerous are marked with warning pictograms.

If the device remains easily accessible to persons, then extra safety precautions (e.g. fencing) must be installed. When safeguards are not possible, make sure clear instructions are given to people using the device.

**Danger of magnetic field**

The magnets generate a powerful magnetic field that strongly attracts ferromagnetic (Fe) materials. Always take into account that these materials may suddenly be drawn towards the magnet, very powerfully. This applies to steel workbenches and steel tools, but also to Ferromagnetic materials carried on your person, such as coins in your wallet or your keys. Make use of non-magnetic tools and workbenches fitted with a wooden worktop and preferably a non-Fe frame (for instance stainless steel).

Always be aware that Ferromagnetic parts will be attracted -- even personal items - if you are closer than 0.3 meter to a magnet.

***Danger - strong magnetic field!***

People fitted with pacemakers should on no account enter the magnetic field (within a radius of 1 meter).

***Prohibited for people with pacemakers!***

Credit cards, chip cards, computer disks/tapes, computer screens, watches, etc. may be damaged or destroyed if they enter the magnetic field (within a radius of 0.5 meter).

***Danger for magnetic cards!***

General public and pregnant personnel should keep a minimal distance of 0.25 m from the magnet.

## Device description

### Intended use / user indications

#### Intended use

The **magnet rail** is an aid for transporting cans or lids. The cans or lids stand or lie on a transport belt, while being attracted by the fixed magnets through the transport belt.

#### Temperatures min / max

Outside temperatures from -20 °C to +40 °C.

Surrounding temperatures up to max. +80 °C for standard Neoflux® magnet material.

Surrounding temperatures up to max. +100 °C for Ferrite magnet material.

The magnet is to be protected against higher temperatures than prescribed, because the magnet might **lose magnetic force permanently** when exposed to high temperatures

#### Free space

Make sure that there is enough free space around the device to perform and ease the cleaning, inspection and maintenance operation.

#### Noise level

---

#### Vibrations

The magnet is to be protected against strong external vibrations, because the magnet might **lose magnetic force permanently** and or the brittle ceramic magnet material might break.

#### Cleaning

Clean magnets have the best attractive/holding result. So, make sure to clean more often than assumed necessary, to achieve a satisfactory result of the magnet device.

For more dirt cleaning info, see chapter [Maintenance](#)

**Deliverable specials****Temperatures**

Magnetic forces can vary with changes in temperature. With temperatures above 50°C the attraction reduces.

However, this reverts to the original value if the magnet cools down to room temperature. If the temperature of the magnets rises to above the so-called Curie point, the magnetic force can definitely be lost. As a rule of thumb it can be accepted that Ferrite magnetic components can be used up to 200°C and Neoflux® magnetic components to 80°C.

**Abrasive products**

If the belt bottom side is abrasive, then we can supply the magnet rail housing with a protective coating.

**Use in FOOD****Standard execution:**

The magnet rail is waterproof filled with 2 component PU moulding. Magnetic side is stainless steel thin plate (cap) and mounting side plate is steel. Both cap and mounting plate are painted.

**Standard FOOD execution:**

Complete SS outside, unpainted.

**Special FOOD execution:**

The magnet can be (extra special) adapted on request to other – for instance prescribed or delivered by customer – food improved materials. Surface treatments like electrolytic polishing, staining, etc. are also possible.

## Working principle

The **magnet rail** is an aid for transporting ferromagnetic products, standing or lying on a transport belt, while being attracted by the fixed magnets straight through the transport belt.

It is possible to transport body/bodies, empty or full tins, lids, crown corks, aerosol cans. Besides turnkey installations, Goudsmitt also delivers the loose components to construct a magnetic transport installation by yourself. Determining the appropriate magnet type depends on the form, belt type and speed, just as the environment where this will take place.

**Factors that will play a role are:**

- Product dimensions (l x w x h).
- Position on the belt (open side or closed side on the magnet).
- Belt speed and supply angle.
- Weight (full or empty can).
- Dry or wet environment. In case of a wet environment the magnets must be protected against rust. This is not only caused by water, but more and more frequently by aggressive cleaning detergents.
- Temperature (this can yield problems above 60 degrees).

## Mounting examples

Magnet rails can be used with for various functions.

For each function a different magnet rail type design is to be used.

### Explanatory table of magnet rail functions and designs.

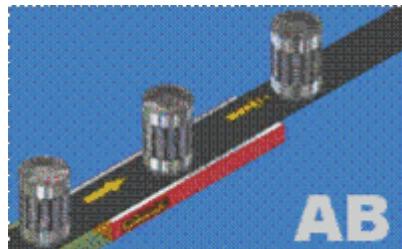

#### Type AA: Straight through design

Magnetic rail for straight product flow with constant magnetic force.  
Suitable for fitting in-between other magnetic rails.

#### Types AB: Decreasing design

Magnetic rail with decreasing magnetic field for transfer from magnetic to non-magnetic conveyance and vice versa. The decreasing magnetic field guarantees a smooth and trouble-free transfer. Type AB for fitting at the end of the magnetic path.

#### Types AC: Increasing design

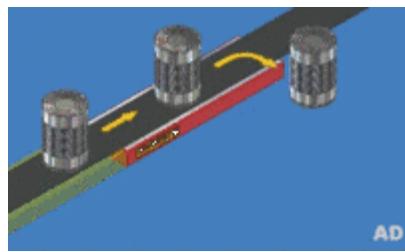

Magnetic rail with increasing magnetic field for transfer from non-magnetic to magnetic conveyance and vice versa. The increasing magnetic field guarantees a smooth and trouble-free transfer. Type AC for fitting at the beginning of the magnetic path.

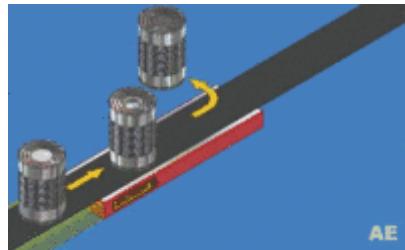

**Types AD and AE: Reduced pole design**

Magnetic rail with reduced magnetic pole for side-ways discharge at the end of the magnetic path.

Type **AD** with reduced North pole for discharge to the right.

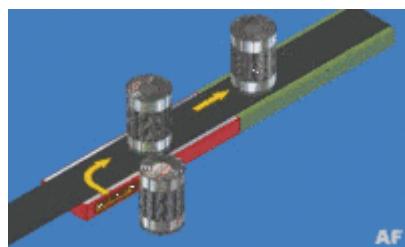

Type **AE** with reduced South pole for discharge to the left.

**Types AF and AG: Reduced pole design**

Magnetic rail with reduced magnetic pole for side-ways entry at the beginning of the magnetic path.

Type **AF** with reduced North pole for entry from the right

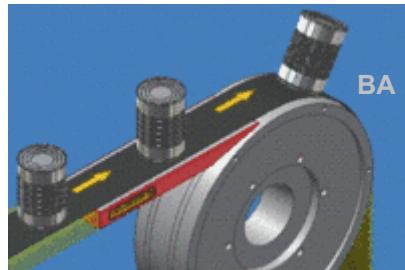

Type **AG** with reduced South pole for entry from the left.

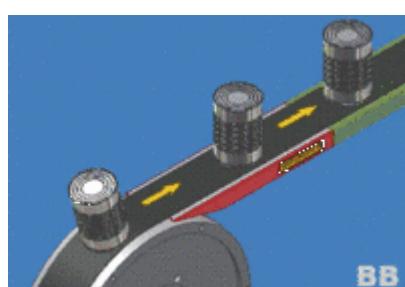

**Types BA and BB: Sloping design**

Magnetic rail with sloping shape for optimum connection to a magnetic roller.

Type **BA** for fitting before a magnetic roller.

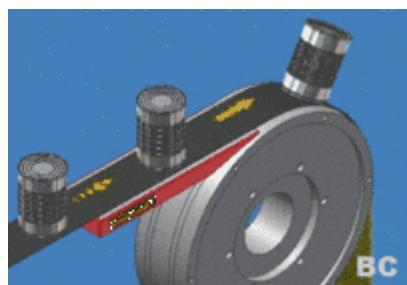

Type **BB** for fitting after a magnetic roller.

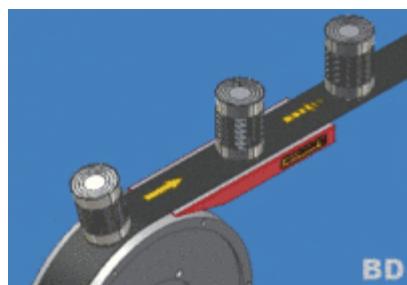

**Types BC and BD: Sloping and decreasing design:**

Magnetic rail with sloping shape and decreasing magnetic field for transfer from non-magnetic to magnetic conveyance and vice versa.

Type **BC** for fitting before a magnetic roller  
(decreasing)

Type **BD** for fitting after a magnetic roller  
(increasing)

**Selection of Components**

Selection table for standard magnetic rail systems and their applications						
Series Code	Dim. Width x height w x h [mm]	Type magnetic system	Application: For conveying	Max. product dimensions (mm)	Max. rising angle	Max. transport speed (m/min)
TB - 01	52 x 17	2 pole Ferrite 1300 Gauss For dry conditions	Crown corks, lids, battery cases, screw-tops, tomato cans	Lids ø153 Caps ø83	0 - 90°	120
			Vertical transport of empty cans (with the bottom on the conveyer belt)	Ø65 x 145	0 - 90°	120

## Arcs and bends table

### D A : Magnetic arc design

Magnetic arc rail for straight product flow with constant magnetic force.

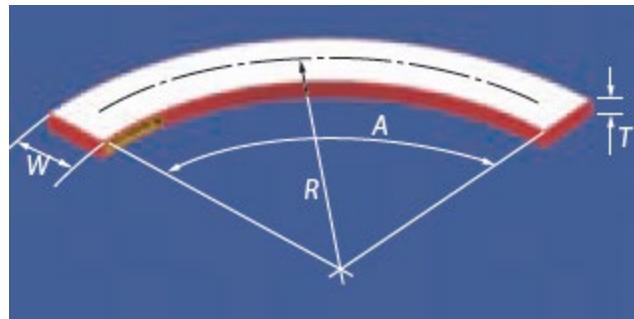

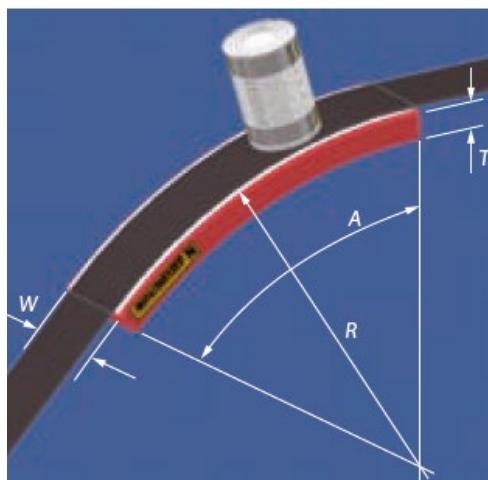

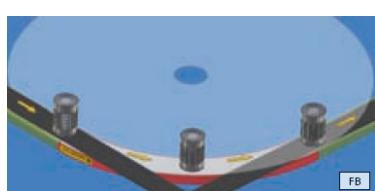

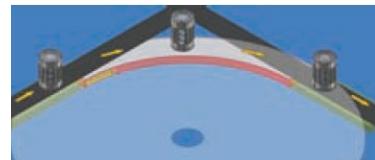

Suitable for fitting in between other magnetic rails, as alternative to a magnetic roller.

### F A F B : Magnetic curve design

Magnetic curve rail for a product flow that branches off is usually combined with a powered disc and crossed conveyor belts. The magnetic force is constant.

Type FA for branching off to the right (curve rail clockwise).

Type FB for branching off to the left (curve rail counter-clockwise).

## Device description

With this table it is possible to determine the transition between the various magnet rails and roles.

Type code standard arc rail		Cross section W x T (mm)		Angle A (°)	Radius R (mm)	Gewicht kg	Type code standard curve rail		Cross section W x T (mm)		Angle A (°)	Radius R (mm)	Weight (kg)

**Magnet materials**

Magnet rails can be equipped with Neoflux® or with Ferroxdure magnets:

*Executions with other magnet materials are also possible, but in practice only these 2 materials are used so far.*

**Ferroxdure magnets**

- Cheaper (in reality, depending on the position of the magnet)
- Have good penetration (up to max. 400 mm)
- Can be employed up to approximately 250°C
- Value at magnetic poles; app. 2800 Gauss → depends on type
- Not suitable for capturing stainless steel particles

**Neoflux® magnet rails**

- Are minimum 4 times as powerful, but more sensitive to temperature than Ferroxdure magnets
- As a result they can be constructed in a light and compact manner
- Standard model can be employed up to 80°, special model to 220° (so far)
- Value at magnetic poles; app. 10.000 Gauss → depends on type
- Model is completely of stainless steel and is completely waterproof (IP67)

For a wide overview of plate magnets and their positioning in relation to the material flow, also read the brochure on our website.

**Installation****STRONG MAGNET FIELD**

Make sure to have read the safety chapter before installation with magnets.  
This may prevent for serious injuries!!!

**Extra attention when unwrapping / unpacking / installing the magnet rail:**

Always be aware that the magnets can be powerfully attracted or repelled, depending on whether the magnetic fields attract or repel, when they are close to another.

**Danger - jamming of body parts**

**Start-up****Before start-up, make sure that:**

- The device or the installation has no damages or malfunctions.
- All connections (electrical, mechanical, pneumatic) have been made properly.
- The device or the installation is placed and situated correctly.
- All protective covers (if applicable) have been fitted correctly.
- There are no other sources of danger present.

**During start-up, make sure that:**

- The device or the installation has no damages or malfunctions.
- All other parts of the device or installation function as described.

**STRONG MAGNET FIELD**

Make sure to have read the safety chapter before startup an installation with magnets.  
This may prevent for serious injuries!!!

## Maintenance

Magnetic systems attract Ferromagnetic particles. Regular cleaning is essential. A clean magnet functions considerably better.

*All parts are best cleaned with pressurized air and/or a soft cloth. It's also possible to deep clean with special cleaning fluids that do not harm the material. Ensure that these fluids do not contaminate the product*

Regularly check that all warning pictograms and the identification plate are present at the correct locations on the device. If warning pictograms or the identification plate should get lost or damaged, immediately apply new ones to the original locations.

Always inform operating personnel regarding planned inspections, maintenance, repairs or if attending to breakdowns.

### STRONG MAGNET FIELD

Make sure to have read the safety chapter before doing maintenance work with magnets; this may prevent for serious injuries!!!

**The magnetic field is permanent, so also active during maintenance and/or cleaning of the magnet!**

**Only do maintenance works to the magnet when the material stream is halted.**

**Maintenance activities are indicated in the icons below:**

### Inspection

- Inspect regularly on magnet power and wear;
- Inspect regularly whether warning pictograms and identification plate / sticker / etching are still present and readable;

### Cleaning

- Magnetic systems attract dust and ferromagnetic material, so regularly cleaning is necessary to prevent for further damage.

**Wear security gloves, glasses, and other necessary safety clothing while cleaning the magnet!!!**

### Replace / Revise

- Replace worn out or broken parts immediately.
- Also replace any warning pictograms immediately if they are damaged or lost.

**Magnet system**

Wear caused by abrasive belt can be minimized by coating with a protective coating.  
For information, consult: **GOUDSMIT magnetic systems**

- When the magnetic surface of the magnet rail is bumped, then probably the magnets inside are damaged to.

**Bumped magnets** should be revised or replaced, to prevent for further damage inside the magnet system and for the magnetic force lowering as a consequence.

## Malfunctions/Service

### CAUTION!

Improper handling of the magnet device may lead to damages.  
Potential damage to body and or property!

- Any repair to GOUDSMIT magnet devices may be performed by qualified personnel only.
- Be aware that permanent magnets attract ferromagnetic material with great force when it gets in reach of the magnetic field → danger of getting jammed!
- Consult GOUDSMIT MAGNETIC SYSTEMS service

## Malfunctions

In case of malfunctions, consult the following table in order to determine the cause of the malfunction and its possible remedy. In case a specific malfunction can't be found in the table, consult the **GOUDSMIT Magnetic Systems** service.

Malfunction	Possible cause	Possible Remedy
Magnet does not attract the ferromagnetic cans, lids, caps, plates or other product, or attracts them too little.	Not attracted products are not (enough) ferromagnetic.	Check if particles to be transported are (enough) ferromagnetic, using a small permanent magnet. <ul style="list-style-type: none"> <li>• not attracted: the particles cannot be separated with a (any) magnet.</li> <li>• slightly attracted: possibly a magnet with a higher capacity can do the job, so contact Goudsmit for consultancy.</li> </ul>
	In case of cans, the cans are not placed with bottoms on the belt (towards the magnets), causing them to have too little ferromagnetic material to attract.	Place cans with bottoms on the belt.
	Belt is to thick, causing the product to be to far away from the magnets to get attracted.	<ol style="list-style-type: none"> <li>1. Use a thinner belt, The thinner the better the better the attraction.</li> <li>2. Use stronger magnets when belt cannot be thinner.</li> </ol>

## Customer service

Please have the following information available if you require customer service assistance:

- Identification plate (complete).
- Type and extent of the problem.
- Time the problem occurred and any accompanying circumstances.
- Assumed cause.

**Spare parts**

As a result of the robustness and quality of **GOUDSMIT Magnetic Systems** products the device possesses high operational reliability.

When however a specific component requires replacement, the correct component can be ordered by quoting the type number stated on the *identification plate* or on one of the drawing(s) added to this user manual in the added data sheet.

The spare parts are mostly wear parts, such as:

Only the slide plate of the magnet might have to be replaced/revised after time, when constantly submitted to an abrasive belt.

Following mutual consultation Goudsmits magnetic systems will arrange rapid and correct delivery.

**Storage and Dismantling****Storage**

If the device will not be used for a long period of time, we advise to store the device in a dry, safe place and to conserve fragile and/or sensitive parts.

**Dismantling / scrapping**

On scrapping and/or disposal of the device's parts separately, take into account the different nature and dangers of the components (magnets, iron, aluminium, electrical parts, insulating materials, etc.) and ensure safe disposal. Preferably entrust the task to a specialised company, and always observe the local regulations in regard to disposal of industrial waste.
